

REMARKS

The Office Action mailed September 26, 2007 has been carefully considered.

Reconsideration in view of the following remarks is respectfully requested.

Claim Status and Amendment of the Claims

Claims 2-9, 13-20, 24-31, and 36-43 are currently pending.

No claims stand allowed.

Claims 1, 10-12, 21-23, 32-35, and 44-45 were previously cancelled without prejudice or disclaimer of the subject matter contained therein.

Claims 2-9, 13-20, 24-31, and 36-43 have been amended to further particularly point out and distinctly claim subject matter regarded as the invention. Specifically, all occurrences of “said” have been replaced with “the.” Support for these changes may be found in the specification, figures, and claims as originally filed.

The 35 First U.S.C. § 103 Rejection

Claims 2-9, 13-20 and 24-31 stand rejected under 35 U.S.C. § 103(a) as allegedly being unpatentable over Malan et al.¹ in view of Strother,² among which claims 2, 13, and 24 are independent claims.³ This rejection is respectfully traversed.

According to the Manual of Patent Examining Procedure (M.P.E.P.),

To establish a *prima facie* case of obviousness, three basic criteria must be met. First there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify the reference or to combine reference teachings. Second, there must be a reasonable expectation of success. Finally, the prior art reference (or references when combined) must teach or

¹ U.S. Publication No. 2002/0035698 to Malan et al.

² Strother, E., “Denial of Service Protection: The Nozzle, August 29, 2000 (apparent authorship date), published in “Proceedings of the 16th Annual Computer Security Applications Conference (ACSAC '00)”, December 13, 2000.

³ Office Action mailed September 26, 2007, p. 2.

suggest all the claim limitations. The teaching or suggestion to make the claimed combination and the reasonable expectation of success must both be found in the prior art, not in the applicant's disclosure.⁴

Claim 2

Claim 2 recites:

A method for preventing denial of service attacks against Hypertext Transfer Protocol (HTTP) servers, the method comprising:
receiving a HTTP request from a subscriber having an established connection over a first communication network coupled to at least one other communication network, the request including a Universal Resource Locator (URL);
receiving a profile for the subscriber;
filtering the request to determine whether the subscriber is authorized to make the request based upon the profile, the filtering including:
updating a client HTTP request count when the request for the URL is a HTTP GET request or a HTTP POST request; and
applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on the client HTTP request count exceeds a maximum HTTP request frequency;
and
forwarding the request to the at least one other communication network when the subscriber is authorized to make the request.

The Examiner states:

... Malan teaches a method for preventing denial of service attacks against Hypertext Transfer Protocol (HTTP) servers (para. [0064], "Protecting Web (HypertextTransfer Protocol, or HTTP) services is one specific application of the DoS scrubber. When scrubbing HTTP traffic, the DoS scrubber separates legitimate from malicious Web requests."), the method comprising:
receiving a HTTP request from a subscriber having an established connection (para. [0066] "The DoS scrubber's forwarding engine serves both as an enforcement mechanism and statistics generator. When Internet Protocol (IP) packets enter the scrubber, they are given to the forwarding engine. Upon receipt, the FE determines if the packets belong to an old request, or are part of a new request. If the request is new, a variety of safeguards remove many of the common types of denial of service-such as TCP SYN floods. However, the safeguards also include checking to see if requesting client has been determined malicious by the analysis engine. If so, the request is dealt with in a policy configured manner. For example, if the service is not overwhelmed, it may allow the request to happen; however it can be throttled back using a custom rate limiter.") over a first communication network (Fig. 1, element "INTERNET", para. [0063] "FIG. 1 shows an example use of the DoS scrubber. It depicts a network server providing a publicly accessible service--a public Web server for example. The DoS scrubber

⁴ M.P.E.P § 2143.

is interposed between the server and the Internet.") coupled to at least one other communication network (para. [0063] "FIG. 1 shows an example use of the DoS scrubber. It depicts a network server providing a publicly accessible service--a public Web server for example. The DoS scrubber is interposed between the server and the Internet.", Fig. 1 showing the network within which "INTERNET SERVER" is located is at least one other communication network. Also note in para. [0051], "The _larger _system as well as the present invention works with the existing routing infrastructure deployed at Internet service providers, application service providers, and enterprise networks.", and para.[0065] "FIG. 2 denotes the denial of service scrubber's high-level architecture. It is comprised of two primary components: the forwarding and the analysis engines. The forwarding engine (FE) has two main responsibilities: applying filtering and rate limiting to sets of Internet hosts, and generating request statistics. The analysis engine (AE) is responsible for the collection and subsequent data mining of the forwarding engine's statistics. Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests."), said request including a Universal Resource Locator (URL) (para. [0064] "Protecting Web (Hypertext Transfer Protocol, or HTTP) services is one specific application of the DoS scrubber;.."); receiving a profile for said subscriber (para. [0026] "One or more user profiles may be generated from the network traffic and wherein the step of analyzing may include the step of comparing the one or more user profiles with a predetermined profile to determine the undesirable user." para. [0027] "The step of generating the one or more user profiles may include the step of generating request statistics for the user from the network traffic.[0028] The request statistics may include connection statistics and service request distributions."); filtering said request to determine whether said subscriber is authorized to make said request based upon said profile (para. [0065] "Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests.") Malan teaches "a HTTP GET request" as well as TCP SYN at [0066] "Upon receipt, the FE determines if the packets belong to an old request, or are part of a new request. If the request is new, a variety of safeguards remove many of the common types of denial of service--such as TCP SYN floods. " "Examples of these statistics include: [0067] Size: the request and subsequent reply's size, both in bytes and packets. [0068] Request payload: content of the request at the application layer (e.g., HTTP GET string); forwarding said request to said at least one other communication network when said subscriber is authorized to make said request. (para. [0066] "However, the safeguards also include checking to see if requesting client has been determined malicious by the analysis engine. If so, the request is dealt with in a policy configured manner. For example, if the service is not overwhelmed, it may allow the request to happen; however it can be throttled back using a custom rate limiter.") Note: Malan teaches preventing a denial of service attack of an established that is a HTTP GET request as well as new connections TCP SYN packet by DoS scrubber through manners of either filtering the requests completely or throttling back their access requests using a custom rate limiter (para, [0063] "..the DoS scrubber can identify malicious users

of the service and either filter completely or throttle back their access.", [0064], "Clients with profiles that are flagged as anomalous are then candidates for their subsequent requests to be attenuated or completely filtered.", f0065], ".Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests.") Malan fails to disclose custom rate limiter (filter) detail including said filtering including: updating a client request count; and applying server denial of service attack preventative measures when a client request frequency based on said client request count exceeds a maximum request frequency.

Strother teaches "The Nozzle" in Fig. 4, page 38 in the form of filtering, said filtering including: updating a client request count (page 38, Right Column, lines 4-7, "Our data structure is actually a queue and a buffer..... ordered by timestamp... Note: This is inherent to have updating the count.) when said request for said URL is a HTTP GET request page 39, Right Column, lines, 6-11, Ring 3 of Fig. 5, ".. HTTP get request."); and applying server denial of service attack preventative measures when a client request frequency based on said client request count exceeds a maximum request frequency. (page 37, Right Column, 35- page 38, Left Column, line 2.)

Thus, Strother teaches "rate limiter" filter to "update a client HTTP request count, and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency. Therefore it would have been obvious to one of ordinary skills in the art to employ "rate limiter" filter to "update a client HTTP request count and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency" as taught by Strother as "a custom rate limiter" of Malan. Using the known technique for updating a client HTTP request count; and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency" to provide the rate limiting mechanism as desired in the DoS Scrubber (Fig. 1, element "DoS Scrubber" and Fig. 2) of Malan would have been obvious to one of ordinary skill.⁵

The Applicants respectfully disagree for the reasons set forth below.

Strother Is Not Prior Art With Respect To The Present Application

According to the M.P.E.P.,

A reference is proven to be a "printed publication" "upon a satisfactory showing that such document has been disseminated or otherwise made available to the extent that persons interested and ordinarily skilled in the subject matter or art, exercising reasonable diligence, can locate it." In re Wyer, 655 F.2d 221, 210

⁵ Office Action dated September 26, 2007, pp. 3-7.

USPQ 790 (CCPA 1981) (quoting I.C.E. Corp. v. Armco Steel Corp., 250 F. Supp. 738, 743, 148 USPQ 537, 540 (SDNY 1966))⁶

The filing date for the present application is December 11, 2000. The first page of the Strother reference shows a date of August 29, 2000, which is apparently a date of authorship and not a date of publication. The Strother reference and other papers were presented at the Sixteenth Annual Computer Security Applications Conference held between December 11, 2000 and December 15, 2000. The Strother reference and the other papers presented at the conference were bundled into a single publication (“Proceedings”) that was released on December 13, 2000, which was the first day that papers were presented at the conference. The Table of Contents for the “Proceedings” publication is included as an appendix to this Response. Page “v” of the Proceedings shows the Strother reference was presented on December 13, 2000.

A document entitled “Conference Proceedings Order Plan Spreadsheet 1998-2001” (“Spreadsheet”) is also included as an appendix to this Response. The Spreadsheet document was obtained from the publisher’s website:

<http://www.ieee.org/web/publications/confproc/index.html>. As shown on page 9 of the Spreadsheet (12th row), the Proceedings was released on December 13, 2000.

As Strother was disseminated after the filing date for the present application, Strother is not *prior* art with respect to the present application. Accordingly, Strother is ineffective as a prior art reference against the present application. For this reason, a *prima facie* case has not been established and the rejection must be withdrawn.

Claim 13

Claim 13 is an *In re Beauregard* claim corresponding to method claim 2. Claim 2 being allowable, Claim 13 must also be allowable for at least the same reasons as Claim 2.

⁶ M.P.E.P. § 2128.

Dependent Claims 3-9 and 14-20

Claims 3-9 depend from Claim 2. Claims 14-20 depend from Claim 13. Claims 2 and 13 being allowable, Claims 3-9 and 14-20 must also be allowable for at least the same reasons as Claims 2 and 13, respectively.

The Second 35 U.S.C. § 103 Rejection

Claims 36-43 stand rejected under 35 U.S.C. § 103(a) as allegedly being unpatentable over Malan et al. in view of Strother, and further in view of Dynarski et al.,⁷ among which claim 36 is an independent claim. This rejection is respectfully traversed.

Claim 36

Claim 36 recites:

An apparatus capable of preventing denial of service attacks against Hypertext Transfer Protocol (HTTP) servers, the apparatus comprising:
a first receiving interface capable of accepting a HTTP request received from a subscriber having an established connection originating from a first communication network, the request including a Universal Resource Locator (URL);
a profile request generator capable of generating a profile request based upon the HTTP request;
a first forwarding interface capable of sending the profile request to an Authentication, Authorization, and Accounting (AAA) server;
a second receiving interface capable of accepting a requested profile;
a filter capable of determining whether the HTTP request is authorized based upon the requested profile, the filter including:
an updater to update a client HTTP request count when the HTTP request for the URL is a HTTP GET request or a HTTP POST request; and
a responder to apply HTTP server denial of service attack preventative measures when a client HTTP request frequency based on the client HTTP request count exceeds a maximum HTTP request frequency;
an authorizer capable of allowing the HTTP request to be forwarded on at least one other communication network coupled to the first communication network; and

⁷ U.S. Patent No. 6,628,671 to Dynarski et al.

a second forwarding interface capable of forwarding the HTTP request on the at least one other communication network.

The Examiner states:

... Malan teaches an apparatus capable of preventing denial of service attacks against Hypertext Transfer Protocol (HTTP) servers, said apparatus comprising: (para. [0064], "Protecting Web (Hypertext Transfer Protocol, or HTTP) services is one specific application of the DoS scrubber. When scrubbing HTTP traffic, the DoS scrubber separates legitimate from malicious Web requests."), the method comprising:

a first receiving interface capable of accepting a HTTP request received from a subscriber, (para. [0066] "The DoS scrubber's forwarding engine serves both as an enforcement mechanism and statistics generator. When Internet Protocol (IP) packets enter the scrubber, they are given to the forwarding engine. Upon receipt, the FE determines if the packets belong to an old request, or are part of a new request. If the request is new, a variety of safeguards remove many of the common types of denial of service--such as TCP SYN floods. However, the safeguards also include checking to see if requesting client has been determined malicious by the analysis engine. If so, the request is dealt with in a policy configured manner. For example, if the service is not overwhelmed, it may allow the request to happen; however it can be throttled back using a custom rate limiter.") having an established connection originating from a first communication network (Fig. 1, element "INTERNET", para. [0063] "FIG. 1 shows an example use of the DoS scrubber. It depicts a network server providing a publicly accessible service--a public Web server for example. The DoS scrubber is interposed between the server and the Internet." Also note in para. [0051], "The larger system as well as the present invention works with the existing routing infrastructure deployed at Internet service providers, application service providers, and enterprise networks.", and para.[0065] "FIG. 2 denotes the denial of service scrubber's high-level architecture. It is comprised of two primary components: the forwarding and the analysis engines. The forwarding engine (FE) has two main responsibilities: applying filtering and rate limiting to sets of Internet hosts, and generating request statistics. The analysis engine (AE) is responsible for the collection and subsequent data mining of the forwarding engine's statistics. Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests."), request including a Universal Resource Locator (URL) (para. [0064] "Protecting Web (Hypertext Transfer Protocol, or HTTP) services is one specific application of the DoS scrubber.");

a profile request generator capable of generating a profile request based upon said HTTP request; a second receiving interface capable of accepting a requested profile; (para. [0026] "One or more user profiles may be generated from the network traffic and wherein the step of analyzing may include the step of comparing the one or more user profiles with a predetermined profile to determine the undesirable user." para. [0027] "The step of generating the one or more user profiles may include the step of generating request statistics for the user from the

network traffic.[0028] The request statistics may include connection statistics and service request distributions.");

a filter capable of determining whether said HTTP request is authorized based upon said requested profile, said filter including: (para. [0065] "Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests.")

Malan teaches "a HTTP GET request" as well as TCP SYN at [0066] "Upon receipt, the FE determines if the packets belong to an old request, or are part of a new request. If the request is new, a variety of safeguards remove many of the common types of denial of service--such as TCP SYN floods. " "Examples of these statistics include: [0067] Size: the request and subsequent reply's size, both in bytes and packets. [0068] Request payload: content of the request at the application layer (e.g., HTTP GET string).

an authorizer capable of allowing said HTTP request to be forwarded on at least one other communication network coupled to said first communication network (para. [0026] "One or more user profiles may be generated from the network traffic and wherein the step of analyzing may include the step of comparing the one or more user profiles with a predetermined profile to determine the undesirable user." para. [0027] "The step of generating the one or more user profiles may include the step of generating request statistics for the user from the network traffic.[0028] The request statistics may include connection statistics and service request distributions."); and

a second forwarding interface capable of forwarding said HTTP request on said at least one other communication network. (para. [0066] "However, the safeguards also include checking to see if requesting client has been determined malicious by the analysis engine. If so, the request is dealt with in a policy configured manner. For example, if the service is not overwhelmed, it may allow the request to happen; however it can be throttled back using a custom rate limiter.")

Note: Malan teaches preventing a denial of service attack of an established that is a HTTP GET request as well as new connections TCP SYN packet by DoS scrubber through manners of either filtering the requests completely or throttling back their access requests using a custom rate limiter (para, [0063] "..the DoS scrubber can identify malicious users of the service and either filter completely or throttle back their access.", [0064], "Clients with profiles that are flagged as anomalous are then candidates for their subsequent requests to be attenuated or completely filtered." [0065], "Upon detection of malicious hosts, appropriate actions are fed back from the analysis engine to the forwarding engine for filtering or rate limiting the host's requests.")

Malan fails to disclose custom rate limiter (filter) detail including said filtering including: an updater to update a client request count; updating a client request count; and a responder to apply denial of service attack preventative measures when a client request frequency based on said client request count exceeds a maximum request frequency. Strother teaches "The Nozzle" in Fig. 4, page 38 in the form of filtering, said filtering including: updating a client request count (page 38, Right Column, lines 4-7, "Our data structure is actually a queue and a buffer..... ordered by timestamp... Note: This is inherent to have updating the count.) when said request for said URL is a HTTP GET request page 39, Right

Column, lines, 6-11, Ring 3 of Fig. 5, ".. HTTP get request."); and a responder to apply server denial of service attack preventative measures when a client request frequency based on said client request count exceeds a maximum request frequency. (page 37, Right Column, 35- page 38, Left Column, line 2.) Thus, Strother teaches "rate limiter" filter to "update a client HTTP request count, and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency. Therefore it would have been obvious to one of ordinary skills in the art to employ "rate limiter" filter to "update a client HTTP request count and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency" as taught by Strother as "a custom rate limiter" of Malan. Using the known technique for updating a client HTTP request count; and applying HTTP server denial of service attack preventative measures when a client HTTP request frequency based on said client HTTP request count exceeds a maximum HTTP request frequency' to provide the rate limiting mechanism as desired in the DoS Scrubber (Fig. 1, element "DoS Scrubber and Fig. 2) of Malan would have been obvious to one of ordinary skill. Both, Malan as well as Strother fail to teach "a first forwarding interface capable of sending said profile request to an Authentication, Authorization, and Accounting (AAA) server." Malan teaches a profile request generator capable of generating a profile request based upon said HTTP request; a second receiving interface capable of accepting a requested profile; (para. [0026] "One or more user profiles may be generated from the network traffic and wherein the step of analyzing may include the step of comparing the one or more user profiles with a predetermined profile to determine the undesirable user." para. [0027] 'The step of generating the one or more user profiles may include the step of generating request statistics for the user from the network traffic.[0028] The request statistics may include connection statistics and service request distributions.") with having the profile locally available. Dynarski teaches a first forwarding interface capable of sending said profile request to an Authentication, Authorization, and Accounting (AAA) server". (col. 6, line 36-39, "The authentication server 28, in a preferred embodiment, comprises a general purpose computer functioning as a RADIUS server (a known device) providing accounting, authorization and authentication functions for a plurality of mobile users.") Therefore it would have been obvious to one of ordinary skills in the art to employ Authentication, Authorization, and Accounting (AAA) server of Dynarski replacing the profile generator of Malan, that is substituting one method for the other to achieve the predictable result of extracting the user profile from Authentication Authorization and Accounting (AAA) server.⁸

The Applicants respectfully disagree for the reasons set forth below.

⁸ Office Action, pp. 16-22.

Strother Is Not Prior Art With Respect To The Present Application

The arguments made above with respect to Claim 2 apply here as well. As Strother was disseminated after the filing date for the present application, Strother is not *prior* art with respect to the present application. Accordingly, Strother is ineffective as a prior art reference against the present application. For this reason, a *prima facie* case has not been established and the rejection must be withdrawn.

Dependent Claims 37-43

Claims 37-43 depend from Claim 36. Claim 36 being allowable, Claims 37-43 must also be allowable for at least the same reasons as Claim 36.

Claims 24-31

Claims 24-31 are means-plus-function apparatus claims. In support of the 35 U.S.C. § 103 rejection of Claims 24-31 based on Malan et al. in view of Strother, the Examiner refers to substantially the same portions of Malan et al. and Strother used in the rejection of method claims 2-9, *In re Beauregard* claims 13-20, and non-means-plus-function apparatus claims 36-43. The Examiner is referred to the U.S. Patent and Trademark Office document entitled "Examination Guidelines For Claims Reciting A "Means or Step Plus Function" Limitation In Accordance With 35 U.S.C § 112, 6th Paragraph" ("Guidelines"), a copy of which is submitted herewith for the Examiner's convenience. The Guidelines state:

... Per our holding, the 'broadest reasonable interpretation' that an examiner may give means-plus-function language is that statutorily mandated in paragraph six. Accordingly, *the PTO may not disregard the structure disclosed in the specification corresponding to such language when rendering a Patentability determination ...*

... [The] examiner shall interpret a § 112, 6th paragraph “means or step plus function” limitation in a claim as limited to the corresponding structure, materials or acts described in the specification and equivalents thereof in acts accordance with the following guidelines.⁹

The Guidelines state further:

... if a prior art reference teaches identity of function to that specified in a claim, then under Donaldson an examiner carries the initial burden of proof for showing that the prior art structure or step is the same as or equivalent to the structure, material, or acts described in the specification which has been identified as corresponding to the claimed means or step plus function.¹⁰

As Claims 24-31 of the present application are means-plus-function claims and Claims 1-9, 13-20, and 36-43 of the present application are non-means-plus-function claims, they cannot be said to be drawn to identical subject matter. Furthermore, the Examiner has not shown for each means-plus-function claim, that the prior art structure or step is the same as or equivalent to the structure, material, or acts described in the specification which has been identified as corresponding to the claimed means or step plus function. Therefore, the Examiner has not established a *prima facie* case and the 35 U.S.C. § 103 rejection of Claims 24-31 must be withdrawn.

In view of the foregoing, it is respectfully asserted that the claims are now in condition for allowance.

Conclusion

It is believed that this Amendment places the above-identified patent application into condition for allowance. Early favorable consideration of this Amendment is earnestly solicited.

⁹ “Examination Guidelines For Claims Reciting A “Means or Step Plus Function” Limitation In Accordance With 35 U.S.C § 112, 6th Paragraph,” U.S. Patent and Trademark Office, <http://www.uspto.gov/web/offices/pac/dapp/pdf/exmgu.pdf>, p. 1. (emphasis added)

¹⁰ Guidelines at p. 3. (emphasis in original)

If, in the opinion of the Examiner, an interview would expedite the prosecution of this application, the Examiner is invited to call the undersigned attorney at the number indicated below.

The Applicant respectfully requests that a timely Notice of Allowance be issued in this case.

**Examination Guidelines For Claims
Reciting A "Means or Step Plus Function" Limitation
In Accordance With 35 U.S.C § 112, 6th Paragraph**

The purpose of this memo is to set forth guidelines for the examination of § 112, 6th paragraph "means or step plus function" limitations in a claim. The court of Appeals for the Federal Circuit, in its en banc decision In re Donaldson 29 USPQ 2d 1845 (Fed. Cir. 1994), decided that a "means-or-step-plus-function" limitation should be interpreted in a manner different than patent examining practice has dictated for at least the last forty-two years. The Donaldson decision affects only the manner in which the scope of a "means or step plus function" limitation in accordance with § 112, 6th paragraph, is interpreted during examination. Donaldson does not directly affect the manner in which any other section of the patent statutes is interpreted or applied.

When making a determination of patentability under 35 U.S.C. §§ 102 or 103, past practice was to interpret a "means or step plus function" limitation by giving it the "broadest reasonable interpretation." Under the PTO's long-standing practice this meant interpreting such a limitation as reading on any prior art means or step which performed the function specified in the claim without regard for whether the prior art means or step was equivalent to the corresponding structure, material or acts described in the specification. However, in Donaldson the Federal Circuit stated that:

Per our holding, the "broadest reasonable interpretation" that an examiner may give means-plus-function language is that statutorily mandated in paragraph six. Accordingly, the PTO may not disregard the structure disclosed in the specification corresponding to such language when rendering a Patentability determination.¹

Thus, effective immediately, examiner shall interpret a § 112, 6th paragraph "means or step plus function" limitation in a claim as limited to the corresponding structure, materials or acts described in the specification and equivalents thereof in acts accordance with the following guidelines.

I. Identifying a § 112, 6th paragraph limitation

¹In re Donaldson , 29 USPQ2d 1845, 1850 (Fed. Cir. 1994).

Although there is no magic language that must appear in a claim in order for it to fall within the scope of § 112, 6th paragraph, it must be clear that the element in the claim is set forth, at least in part, by the function it performs as opposed to the specific structure, material, or acts that perform the function. Limitations that fall within the scope of § 112, 6th paragraph include:

- (1) a jet driving device so constructed and located on the rotor as to drive the rotor . . . ² ["means" unnecessary]
- (2) "printing means" and "means for printing" would have the same connotations ³
- (3) force generating means adapted to provide . . . ⁴
- (4) call cost register means, including a digital display for providing a substantially instantaneous display for . . . ⁵
- (5) reducing the coefficient of friction of the resulting film⁶ [step plus function; "step" unnecessary], and
- (6) raising the Ph of the resultant pulp to about 5.0 to precipitate . . . ⁷

²The term "device" coupled with a function is a proper definition of structure in accordance with the last paragraph of § 112. The addition of the words "jet driving" to the term "device" merely renders the latter more definite and specific. Ex parte Stanley, 121 USPQ 621 (Bd. App. 1958).

³Ex parte Klum, 159 USPQ 694 (Bd. App. 1967). However, the terms "plate" and "wing", as modifiers of the structureless term "means," specify no function to be performed, and do not fall under the last paragraph of § 112.

⁴De Graffenreid v. U.S., 20 Ct. Cl. 458, 16 USPQ2d 1321 (Ct. Cl. 1990)

⁵Intellicall Inc. v. Phonometrics Inc., 952 F.2d 1384, 21 USPQ2d 1383 (Fed. Cir. 1992).

⁶In re Roberts, 470 F.2d 1399, 176 USPQ 313 (CCPA 1973).

⁷Ex parte Zimmerley, 153 USPQ 367 (Bd. App. 1966)

In the event that it is unclear whether the claim limitation falls within the scope of §112, 6th paragraph, a rejection under §112, 2d paragraph may be appropriate.

Donaldson does not affect the holding of In re Hyatt, 708 F.2d 712, 218 USPQ 195 (Fed. Cir. 1983) to the effect that a single means claim does not comply with the enablement requirement of § 112, first paragraph. As Donaldson applies only to an interpretation of a limitation drafted to correspond to § 112, 6th paragraph, which by its terms is limited to "an element in a claim to a combination," it does not affect a limitation in a claim is not directed to a combination.

II. Examining Procedure

A. Scope of the Search and Identification of the Prior Art

As noted above, in Donaldson the Federal Circuit recognized that it is important to retain the principle that claim language should be given its broadest reasonable interpretation. This principle is important because it helps insure that the statutory presumption of validity attributed to each claim of an issued patent is warranted by the search and examination conducted by the examiner. It is also important from the standpoint that the scope of protection afforded by patents issued prior to Donaldson are not unnecessarily limited by the latest interpretation of this statutory provision. Finally, it is important from the standpoint of avoiding the necessity for a patent specification to become a catalogue of existing technology. 8

The Donaldson decision thus does not substantially alter examining practice and procedure relative to the scope of the search. Both before and after Donaldson, the application of a prior art reference to a means or step plus function limitation requires that the prior art element perform the identical function specified in the claim. However, if a prior art reference teaches identity of function to that specified in a claim, then under Donaldson an examiner carries the initial burden of proof for showing that the prior art structure or step is the same as or equivalent to the structure, material, or acts described in the specification which has been identified as corresponding to the claimed means or step plus function.

⁸A patent specification need not teach, and preferably omits, what is well known in the art. Hybritech Inc. v. Monoclonal Antibodies, Inc., 802 F.2d 1367, 1384, 231 USPQ 81, 94 (Fed. Cir. 1986).

The "means or step plus function" limitation should be interpreted in a manner consistent with the specification disclosure. If the specification defines what is meant by the limitation for the purposes of the claimed invention, the examiner should interpret the limitation as having the meaning. If no definition is provided, some judgment must be exercised in determining the scope of the limitation.

B. Making a prima facie case of equivalence

If the examiner finds that a prior art element performs the function specified in the claim, and is not excluded by any explicit definition provided in the specification for an equivalent, the examiner should infer from that finding that the prior art element is an equivalent, and should then conclude that the claimed limitation is anticipated by the prior art element. The burden then shifts to applicant⁹ to show that the element shown in the prior art is not an equivalent of the structure, material or acts disclosed in the application. In re Mulder, 716 F.2d 1542, 219 USPQ 189 (Fed. Cir. 1983).¹⁰ The factors to be

⁹No further analysis of equivalents is required of the examiner until applicant disagrees with the examiner's conclusion, and provides reasons why the prior art element should not be considered an equivalent.

¹⁰See also, In re Walter, 618 F.2d at 768, 205 USPQ at 407-08, (a case treating § 112, 6th paragraph, in the context of a determination of statutory subject matter and noting "If the functionally-defined disclosed means and their equivalents are so broad that they encompass any and every means for performing the recited functions . . . the burden must be placed on the applicant to demonstrate that the claims are truly drawn to specific apparatus distinct from other apparatus capable of performing the identical functions"); In re Swinehart, 439 F.2d 210, 212-13, 169 USPQ 226, 229 (C.C.P.A. 1971) (a case in which the CCPA treated as improper a rejection under § 112, 2d paragraph, of functional language, but noted that "where the Patent Office has reason to believe that a functional limitation asserted to be critical for establishing novelty in the claimed subject matter may, in fact, be an inherent characteristic of the prior art, it possesses the authority to require the applicant to prove that the subject matter shown to be in the prior art does not possess the characteristics relied on"); and In re Fitzgerald 619 F.2d 67, 205 USPQ 594 (CCPA 1980) (a case indicating that the burden of proof can be shifted to the applicant to show that the subject matter of the prior art does not possess the characteristic relied on whether the rejection is based on inherency under § 102 or obviousness under § 103).

considered when determining whether the applicant has successfully met the burden of proving that the prior art element is not equivalent to the structure, material or acts described in the applicant's specification are discussed below.

However, even where the applicant has met that burden of proof and has shown that the prior art element is not equivalent to the structure, material or acts described in the applicant's specification, the examiner must still make a §103 analysis to determine if the claimed means or step plus function is obvious from the prior art to one of ordinary skill in the art. Thus, while a finding of non equivalence prevents a prior art element from anticipating a means or step plus function limitation in a claim, it does not prevent the prior art element from rendering the claim limitation obvious to one of ordinary skill in the art.

Because the exact scope of an "equivalent" may be uncertain, it would be appropriate to apply a §102/§103 rejection where the balance of the claim limitations are anticipated by the prior art relied on.¹¹ In addition, although it is normally the best practice to rely on only the best prior art references in rejecting a claim, alternative grounds of rejection may be appropriate where the prior art shows elements that are different from each other, and different from the specific structure, material or acts described in the specification, yet perform the function specified in the claim.

C. Determining whether an applicant has met the burden of providing non-equivalence after a *prima facie* case is made

If the applicant disagrees with the inference of equivalence drawn from a prior art reference, the applicant may provide reasons why the applicant believes the prior art element should not be considered an equivalent to the specific structure, material or acts disclosed in the specification. Such reasons may include, but are not limited to: 1) teachings in the specification that particular prior art is not equivalent, 2) teaching in the prior art reference itself that may tend to show non-equivalence, or 3) Rule 132 affidavit evidence of facts tending to show non-equivalence.

When the applicant relies on teachings in applicant's own specification, the examiner must make sure that the applicant is interpreting the "means or step plus function" limitation in the

¹¹A similar approach is authorized in the case of product-by--process claim because the exact identity of the claimed product or the prior art product cannot be determined by the examiner. re Brown, 450 F.2d 531, 173 USPQ 685 (CCPA 1972).

claim in a manner which is consistent with the disclosure in the specification. If the specification defines what is meant by "equivalents" to the disclosed embodiments for the purpose of the claimed means or step plus function, the examiner should interpret the limitation as having that meaning. If no definition is provided, some judgment must be exercised in determining the scope of "equivalents." Generally, an "equivalent" is interpreted as embracing more than the specific elements described in the specification for performing the specified function,¹² but less than any element that performs the function specified in the claim.

The scope of equivalents embraced by a claim limitation is dependent on the interpretation of an "equivalent". The interpretation will vary depending on how the element is described in the supporting specification. The claim may or may not be limited to particular structure, material or acts (e.g. steps) as opposed to any and all structure, material or acts performing the claimed function, depending on how the specification treats that question.

If the disclosure is so broad as to encompass any and all structure, material or acts for performing the claimed function, the claims must be read accordingly when determining patentability. When this happens the limitation otherwise provided by "equivalents" ceases to be a limitation on the scope of the claim in that an equivalent would be any structure, material or act other than the ones described in the specification that perform the claimed function. For example, this situation will often be found in cases where (1) the claimed invention is a combination of elements, one or more of which are selected from elements that are old per se, or (2) apparatus claims are treated as indistinguishable from method claims.¹³

¹²To interpret "means plus function" limitations as limited to a particular means set forth in the specification would nullify the provisions of § 112 requiring that the limitation shall be construed to cover the structure described in the specification and equivalents thereof. D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574, 225 USPQ 236, 238 (Fed. Cir. 1985).

¹³See, for example, In re Meyer, 688 F.2d 789, 215 USPQ 193 (1982); In re Abele, 618 F.2d at 768, 205 USPQ at 401-08; In re Walter, 618 F.2d 758, 767, 205 USPQ 397, 406-07 (C.C.P.A. 1980); In re Maucorps, 609 F.2d 481, 203 USPQ 812 (C.C.P.A. 1979); In re Johnson, 589 F.2d, 1070, 200 USPQ 199 (C.C.P.A. 1978); and In re Freeman, 573 F.2d at 1246, 197 USPQ at 471.

On the other end of the spectrum, the "equivalents" limitation as applied to a claim may also operate to constrict the claim scope to the point of covering virtually only the disclosed embodiments. This can happen in circumstances where the specification describes the invention only in the context of a specific structure, material or act that is used to perform the function specified in the claim.

When deciding whether an applicant has met the burden of proof with respect to showing non-equivalence of a prior art element that performs the claimed function, the following factors may be considered. First, unless an element performs the identical function specified in the claim, it cannot be a equivalent for the purpose of §112, 6th paragraph. ¹⁴

Second, while there is no litmus test for an "equivalent" that can be applied with absolute certainty and predictability, there are several indicia that are sufficient to support a conclusion that one element is or is not an "equivalent" of a different element in the context of § 112, 6th paragraph. Among the indicia that will support a conclusion that one element is or is not an equivalent of another are:

- 1) Whether the prior art element performs the function specified in the claim in substantially the same results as the corresponding element disclosed in the specification. ¹⁵
- 2) Whether a person of ordinary skill in the art would have recognized the interchangeability of the element shown in the prior art for the corresponding element disclosed in the specification. ¹⁶

¹⁴Pennwalt Corp. v. Durand-Wayland Inc . 833 F.2d 931, 4 USPQ2d 1737 (Fed. Cir. 1987), cert. denied, 484 U.S. 961 (1988).

¹⁵Lockheed Aircraft Corporation v. United States , 193 USPQ 449, 461 (Ct. Cl. 1977). Graver Tank concepts of equivalents are relevant to any "equivalents" determination. Polumbo v. Don-Joy Co., 762 F.2d 696, 975, n. 4, 226 USPQ 5, 8-9, n. 4 (Fed. Cir. 1985).

¹⁶Lockheed Aircraft Corporation v. United States , 193 USPQ 449, 461 (Ct. Cl. 1977). Data Line Corp. v. Micro Technologies. Inc ., 813 F.2d 1196, 1 USPQ2d 2052 (Fed. Cir. 1987).

- 3) Whether the prior art element is a structural equivalent of the corresponding element disclosed in the specification being examined.¹⁷ That is, the prior art element performs the function specified in the claim in substantially the same manner as the function is performed by the corresponding element described in the specification.
- 4) Whether the structure, material or acts disclosed in the specification represents an insubstantial change which adds nothing of significance to the prior art element. 18

These examples are not intended to be an exhaustive list of the indicia that would support a finding that one element is or is not an equivalent of another element for the purposes of § 112, 6th paragraph. A finding according to any of the above examples would represent a sufficient, but not the only possible, basis to support a conclusion that an element is or is not an equivalent. There could be other indicia that also would support the conclusion.

In determining whether arguments or Rule 132 evidence presented by an applicant are persuasive that the element shown in the prior art is not an equivalent, the examiner should consider and weigh as many of the above-indicated or other indicia as are presented by applicant, and should determine whether, on balance, the applicant has met the burden of proof to show non-equivalence. However, under no circumstance should an examiner accept as persuasive a bare statement or opinion that the element shown in the prior art is not an equivalent embraced by the claim limitation. Moreover, if an applicant argues that the "means" or "step" plus function language in a claim is limited to certain specific structural or additional functional characteristics (as opposed to "equivalents" thereof) where the specification does not describe the invention as being only those specific characteristics, the claim should not be allowed until the claim is amended to recite those specific structural or additional functional characteristics. 19

¹⁷In re Bond, 910 F.2d 831, 15 USPQ2d 1566 (Fed. Cir. 1990).

¹⁸Valmont Industries Inc. v. Reinke Manufacturing Co. Inc., 983 F.2d 1039, 25 USPQ2d 1451 (Fed. Cir. 1993).

¹⁹Otherwise, a claim could be allowed having broad functional language which in reality is limited to only the specific structure or steps disclosed in the specification. This would be

Finally, as in the past, applicant has the opportunity during proceedings before the Office to amend the claims so that the claimed invention meets all the statutory criteria for patentability. An applicant may choose to amend the claim by further limiting the function so that there is no longer identity of function with that taught by the prior art element, or the applicant may choose to replace the claimed means plus function limitation with specific structure material or acts that are not described in the prior art.

D. Related issues under Section 112 first or second paragraphs

The Donaldson decision may create some uncertainty as to what applicant regards as the invention. If this issue arises, it should be addressed in a rejection under §112, 2d paragraph. While § 112, 6th paragraph permits a particular form of claim limitation, it can not be read as creating an exception either to the description, enablement or best mode requirements of the 1st paragraph or the definiteness requirement of the 2d paragraph of § 112. In re Knowlton, 481 F.2d 1357, 178 USPQ 486 (CCPA 1973). If a "means or step plus function" limitation recited in a claim is not supported by corresponding structure, material or acts in the specification disclosure, the following rejections should be considered: (1) under § 112, 1st paragraph, as not being supported by an enabling disclosure because the person skilled in the art would not know how to make and use the invention without a description of elements to perform the function; ²⁰ (2) under § 112, 2d paragraph, as being indefinite because the element or step is not defined in the specification by corresponding structure, material or acts; (3) under §§ 102 or 103 where the prior art anticipates or renders obvious the claimed subject matter including the means or step that performs the function specified in the claim. (Theory: since there is no corresponding structure, etc. in the specification to limit the means or step plus function limitation, an equivalent is any element that performs the specified function).

contrary to public policy of granting patents which provide adequate notice to the public as to a claim's true scope.

²⁰The description of an apparatus with block diagrams describing the function, but not the structure, of the apparatus is not fatal under the enablement requirement of § 112, 1st paragraph, as long as the structure is conventional and can be determined without an undue amount of experimentation. In re Ghiron, 442 F. 2d 985, 991, 169 USPQ 723, 727 (CCPA 1971)

III. Avoid confusion with the doctrine of equivalents

An "equivalent" for the purposes of § 112, 6th paragraph, should not be confused with the doctrine of equivalents. The doctrine of equivalents, most often associated with Graver Tank & Mfg. Co. v. Linde Air Products 339 U.S. 605, 85 USPQ 328 (1950), is sometimes applied to do equity among the parties before the court in an infringement action involving an issued patent. The doctrine typically involves a three-part inquiry - whether an accused device performs substantially the same function, in substantially the same way, to obtain substantially the same result as the claimed invention.

Section § 112, 6th paragraph limits the scope of the broad language of "means or step plus function" limitations, in a claim to a combination, to the structures, materials and acts described in the specification and equivalents thereof. The doctrine of equivalents equitable expands exclusive patent rights beyond the literal scope of a claim. ²¹ Accordingly, decisions involving the doctrine of equivalents should not unduly influence a determination under § 112, 6th paragraph during ex parte examination.

²¹Valmont Industries Inc., Reinke Manufacturing Co., Ind., 983 F.2d 1039, 1043, 1044, 25 USPQ2d 1451, 1455 (Fed. Cir. 1993).

Proceedings
16th Annual
Computer Security
Applications Conference
(ACSAC '00)

December 11–15, 2000

New Orleans, Louisiana

Sponsored by
Applied Computer Security Associates

In cooperation with
ACM Special Interest Group on Security, Audit, and Control

Los Alamitos, California

Washington • Brussels • Tokyo

Copyright © 2000 by The Institute of Electrical and Electronics Engineers, Inc.

Table of Contents

16th Annual Computer Security Applications Conference — ACSAC'00

Message from the Conference Chair	xiii
Conference Committee	xiv
Program Committee	xvi
Tutorial Committee	xvii
Reviewers	xviii
Speaker Biographies	xix

Wednesday Morning, December 13

Distinguished Lecturer

Speaker: Dr. Eugene H. Spafford, Purdue University, USA

Wednesday 10:30 A.M., December 13

Track A: Intrusion Detection

Chair: Rich Neely, SAIC, USA

Security Against Compelled Disclosure	2
<i>I. Brown, B. Laurie</i>	
Security Agility in Response to Intrusion Detection	11
<i>M. Petkac, L. Badger</i>	
Two State-based Approaches to Program-based Anomaly Detection	21
<i>C. Michael, A. Ghosh</i>	

Track B: Distributed/Network Security

Chair: Dan Gambel, Mitretek, USA

Denial of Service Protection — The Nozzle	32
<i>E. Strother</i>	
Virtual Enterprise Networks: The Next Generation of Secure Enterprise Networking	42
<i>G. Caroni, S. Kumar, C. Schuba, G. Scott</i>	
Enabling Secure On-Line DNS Dynamic Update	52
<i>Y. Huang, D. Rine, X. Wang, Y. Desmedt</i>	

Wednesday 1:30 P.M., December 13

Track A: Engineering and Analysis

Chair: Jan Filsinger, NAI Labs, USA

Layering Boundary Protections: An Experiment in Information Assurance	60
<i>D. Johnson, L. Benzing</i>	
Extending Java for Package based Access Control.....	67
<i>J. Hale, M. Papa, O. Bremer, R. Chandia, S. Shenoi</i>	
Secure Smart Homes using Jini and UIUC SESAME	77
<i>J. Al-Muhtadi, M. Anand, M. Mickunas, R. Campbell</i>	

Track B: Defining, Computing, and Interpreting Trust

Chair: Daniel Faigin, The Aerospace Corporation, USA

*Panelists: M. Abrams, The MITRE Corporation, USA; M. Bishop, The University of California at Davis, USA;
M. Clifford, The Aerospace Corporation, USA*

Panel Statement	88
-----------------------	----

Wednesday 3:30 P.M., December 13

Track A: Security Policy

Chair: LouAnna Notargiacomo, Trusted Computer Solutions, USA

Implementing Security Policies using the Safe Areas of Computation Approach.....	90
<i>A. dos Santos, R. Kemmerer</i>	
Policy Mediation for Multi-Enterprise Environments	100
<i>P. Galiasso, O. Bremer, J. Hale, S. Shenoi, D. Ferraiolo, V. Hu</i>	
Protection Profiles for Remailer Mixes — Do the New Evaluation Criteria Help?	107
<i>K. Rannenber, G. Iachello</i>	

Track B: Public Key Infrastructure I

Chair: Ross Anderson, Cambridge University, UK

Binding Identities and Attributes using Digitally Signed Certificates	120
<i>J. Park, R. Sandhu</i>	
Applications in Health Care using Public-Key Certificates and Attribute Certificates	128
<i>P. Wohlmacher, P. Pharow</i>	
Scalable Policy Driven and General Purpose Public Key Infrastructure (PKI)	138
<i>V. Prasad, S. Potakamuri, M. Ahern, I. Balabine, M. Lerner, P. Dutta</i>	

Thursday, 8:30 A.M., December 14

Invited Essayist Plenary

Speaker: Butler Lampson, Microsoft, USA

Thursday, 10:30 A.M., December 14

Track A: Access Control I

Chair: Jody Heaney, The MITRE Corporation, USA

A Policy-based Access Control Mechanism for the Corporate Web	150
<i>V. Ungureanu, F. Vesuna, N. Minsky</i>	

Dynamic Access Control through Petri Net Workflows	159
<i>K. Knorr</i>	

Framework for Role-based Delegation Models	168
<i>E. Barka, R. Sandhu</i>	

Track B: Intrusion Detection II

Chair: Matt Bishop, University of California, Davis, USA

A Network Audit System for Host-based Intrusion Detection (NASHID) in Linux	178
<i>T. Daniels, E. Spafford</i>	

Less Harm, Less Worry or How to Improve Network Security by Bounding System Offensiveness	188
<i>B. Bruschi, L. Cavallaro, E. Rosti</i>	

A Self-Extension Monitoring for Security Management	196
<i>H. Jang, S. Kim</i>	

Thursday, 1:30 P.M., December 14

Track A: Collaboration — Can It Be Done Securely?

Chair: Deborah Cooper, D.C. Associates, USA

*Panelists: W. Dawson, Intelligence Community CIO/IA, USA; J. Ingle, National Security Agency, USA;
S. Lipner, Microsoft, USA*

Panel Statement	206
-----------------------	-----

Track B: Security Architecture

Chair: Jay Kahn, The MITRE Corporation, USA

Security Architecture for Federated Cooperative Information Systems	208
<i>P. Bieber, D. Raujol, P. Siron</i>	

Secure Compartmented Data Access over an Untrusted Network using a COTS-based Architecture	217
<i>P. Clark, M. Meissner, K. Vance</i>	

Security Architectures for Controlled Digital Information Dissemination	224
<i>J. Park, R. Sandhu, J. Schifalacqua</i>	

Thursday, 3:30 P.M., December 14

Track A: Engineering and Analysis II

Chair: Christoph Schuba, Sun Microsystems Laboratories, USA

Using Operating System Wrappers to Increase the Resiliency to Commercial Firewalls	236
<i>J. Epstein, L. Thomas, E. Monteith</i>	
On Computer Viral Infection and the Effect of Immunization	246
<i>C. Wang, J. Knight, M. Elder</i>	
ITS4: A Static Vulnerability Scanner for C and C++ Code	257
<i>J. Viegas, J. Bloch, Y. Kohn, G. McGraw</i>	

Track B: Public Key Infrastructure II

Chair: Ann Marmor-Squires, TRW, Inc., USA

A Novel Approach to On-Line Status Authentication of Public-Key Certificates	270
<i>E. Faldella, M. Prandini</i>	
A Reliable, Scalable General-Purpose Certificate Store	278
<i>P. Gutmann</i>	
Introducing Decryption Authority into PKI	288
<i>F. Bao</i>	

Friday, 8:30 A.M., December 15

Track A: E-Commerce

Chair: J. Epstein, webMethods, Inc., USA

Using Attribute Certificates with Mobile Policies in Electronic Commerce Applications	298
<i>V. Doshi, A. Fayad, S. Jajodia, R. MacLean</i>	
Experience with Software Watermarking	308
<i>J. Palsberg, S. Krishnaswamy, M. Kwon, D. Ma, Q. Shao, Y. Zhang</i>	
Efficient Commerce Protocols based on One-Time Pads	317
<i>M. Schneider, E. Felten</i>	

Track B: Security Management

Chair: Meg Weinberg, Mitretek, USA

Policy-based Authentication and Authorization: Secure Access to the Network Infrastructure	328
<i>J. Hayes</i>	
Calculating Costs for Quality of Security Service	334
<i>E. Spyropoulou, T. Levin, C. Irvine</i>	
Usability Meets Security — The Identity-Manager as Your Personal Security Assistant for the Internet	344
<i>U. Jendricke, D. Markotten</i>	

Friday, 10:30 A.M., December 15

Track A: Access Control II

Chair: Dan Thomsen, Secure Computing Corporation, USA

A Flexible Access Control Service for Java Mobile Code.....	356
<i>A. Corradi, R. Montanari, C. Stefanelli, E. Lupu, M. Sloman</i>	
Personal Security Environment on Palm PDA	366
<i>M. Freudenthal, S. Heiberg, J. Willemson</i>	
History-based Distributed Filtering — A Tagging Approach to Network-Level Access Control	373
<i>R. Sailer, M. Kabatnik</i>	

Track B: Cryptography

Chair: Mindy Rudell, Concept Five Technologies, USA

The Chinese Remainder Theorem and its Application in a High-Speed RSA Crypto Chip	384
<i>J. Großschädl</i>	
Fair On-line Gambling	394
<i>W. Zhao, V. Varadharajan, Y. Mu</i>	
An High-Speed ECC-based Wireless Authentication Protocol on an ARM Microprocessor	401
<i>M. Aydos, T. Yanik, Ç. Koç</i>	
Author Index	411
